

Single function machines

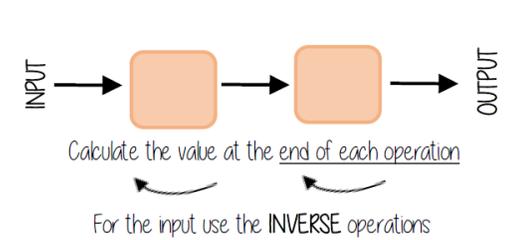

Single function machines (algebra)

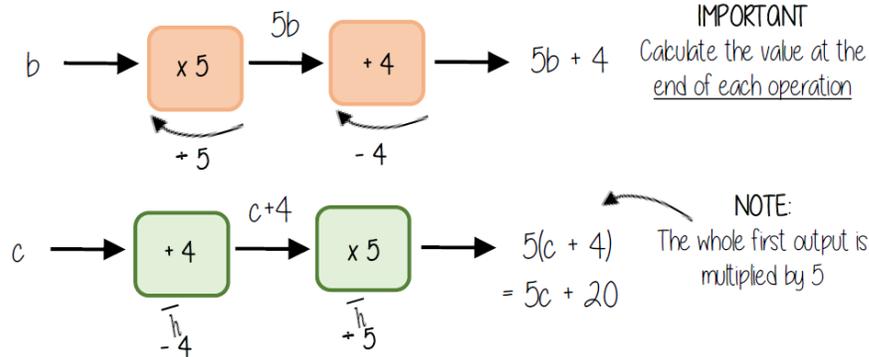

Find functions from expressions

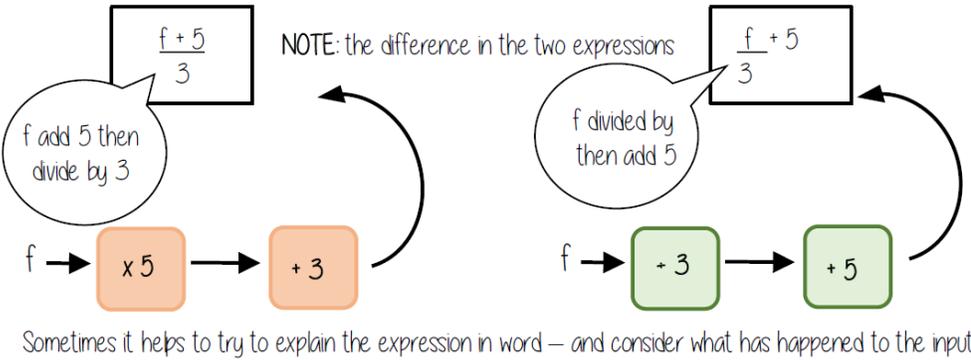

Two step function machines

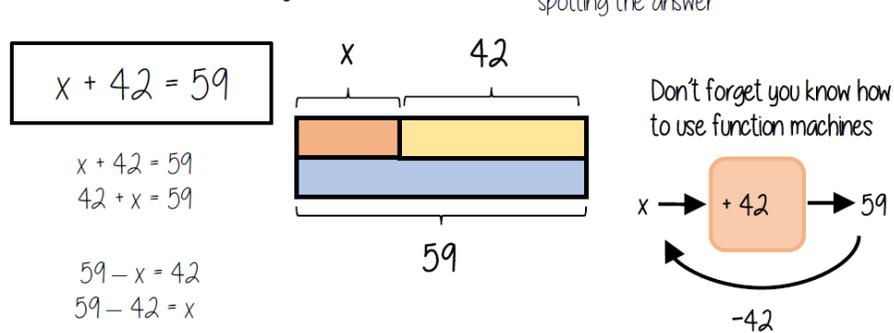

Two step function machines (algebra)

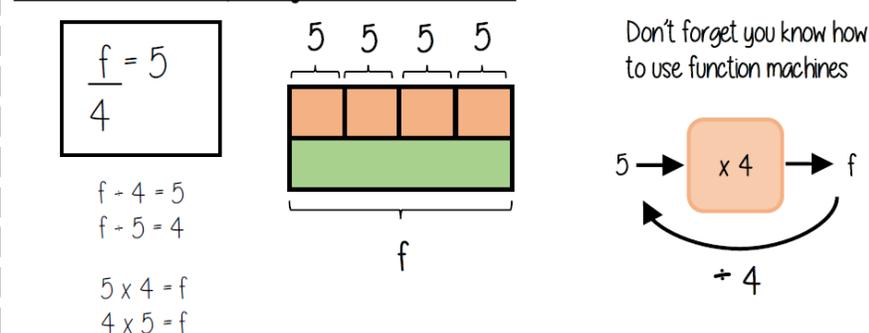

Find functions from expressions

Solve one step equations (+/-)

Solve one step equations (x/+)

**Solve two step equations**

I am trying to find the value of the unknown so I need to get it by itself.

examples

$4a + 2 = 18$  - I need to get a by itself so first I will take away 2 from both sides (the opposite of adding)

$$\begin{array}{r} -2 \quad -2 \\ 4a + 2 = 18 \\ 4a = 16 \end{array}$$

- I still need to get a by itself so I will divide by 4 (4a means 4 x a)

$$\begin{array}{r} +4 \quad +4 \\ 4a = 16 \\ a = 4 \end{array}$$

**Check it!** - Substitute your answer into the original question to see if it is correct

$$4 \times 4 + 2 = 18 \checkmark$$

$\frac{b+2}{3} = 7$  - I need to get b by itself so first I will multiply by 3 from both sides (the opposite of dividing)

$$\begin{array}{r} b+2 = 21 \\ \times 3 \quad \times 3 \\ b+2 = 21 \end{array}$$

- I still need to get b by itself so I will subtract 2 from both sides (the opposite of adding)

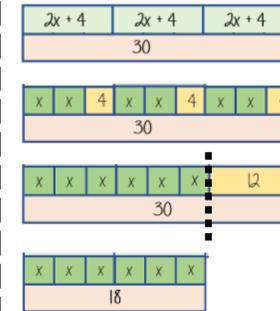

$$\begin{array}{r} -2 \quad -2 \\ b+2 = 21 \\ b = 19 \end{array}$$

**Check it!** - Substitute your answer into the original question to see if it is correct

$$\frac{19+2}{3} = 7 \checkmark$$

**Solve equations with brackets**

$$3(2x + 4) = 30$$

$$3(2x + 4) = 30$$

Expand the brackets

$$6x + 12 = 30$$

$$\begin{array}{r} -12 \quad -12 \\ 6x + 12 = 30 \\ 6x = 18 \end{array}$$

$$\begin{array}{r} +6 \quad +6 \\ 6x = 18 \\ x = 3 \end{array}$$

Substitute to check your answer.  
This could be negative or a fraction or decimal

$$\frac{x}{3} \quad x = 3$$

**Equations with unknown on both sides**

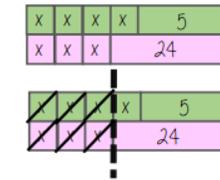

$$4x + 5 = 3x + 24$$

$$\begin{array}{r} -3x \quad -3x \\ 4x + 5 = 3x + 24 \\ x + 5 = 24 \end{array}$$

$$x + 5 = 24$$

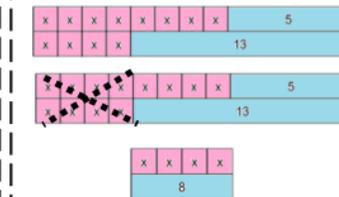

$$\begin{array}{r} -5 \quad -5 \\ x + 5 = 24 \\ x = 19 \end{array}$$

$$x = 19$$

**Equations: unknown on both sides**

$$8x + 5 = 4x + 13$$

$$8x + 5 = 4x + 13$$

$$\begin{array}{r} -4x \quad -4x \\ 8x + 5 = 4x + 13 \\ 4x + 5 = 13 \end{array}$$

$$4x + 5 = 13$$

$$\begin{array}{r} -5 \quad -5 \\ 4x + 5 = 13 \\ 4x = 8 \end{array}$$

$$4x = 8$$

$$\begin{array}{r} \div 4 \quad \div 4 \\ 4x = 8 \\ x = 2 \end{array}$$

**Rearranging Formulae (one step)**

$$x = y + z$$

Rearrange to make y the subject

$$y = x - z$$

$$y \rightarrow +z \rightarrow x$$

$$y \leftarrow -z \leftarrow x$$

Using inverse operations or fact families will guide you through rearranging formulae

Rearranging can also be checked by substitution

Language of rearranging...

Make XXX the subject

Change the subject

Rearrange

**Rearranging Formulae (two step)**

In an equation (find x)

$$\begin{array}{r} 4x - 3 = 9 \\ +3 \quad +3 \\ 4x = 12 \\ \div 4 \quad \div 4 \\ x = 3 \end{array}$$

In a formula (make x the subject)

$$\begin{array}{r} xy - s = a \\ +s \quad +s \\ xy = a + s \\ \div y \quad \div y \\ x = \frac{a+s}{y} \end{array}$$

The steps are the same for solving and rearranging

Rearranging is often needed when using  $y = mx + c$

e.g Find the gradient of the line  $2y - 4x = 9$

Make y the subject first  $y = \frac{4x + 9}{2}$  Gradient =  $\frac{4}{2} = 2$
